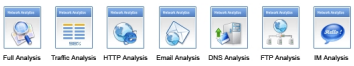
Increase system analysis performance
Improve user's analysis effectiveness



Except for the packet analysis core, all advanced analysis functions are designed as different modules. For example, the HTTP module is dedicated to analyze the HTTP traffic and log web page visits, while the Email module monitors the email communications and saves all monitored emails to your hard disk.

To increase the analysis efficiency, you can easily set up your own analysis profile by assembling the modules you need. To set up a profile that only analyzes email and web page traffic, you only choose the Email and HTTP analysis modules. By selecting only analysis modules you are interested in, the program is able to filter out all unnecessary data to quickly provide you the useful information you are seeking.
