What's broadcast traffic?

In Ethernet, all communications are based on broadcast. By default, every host must process all broadcast packets in the network. The traffic that broadcast packets occupy is called broadcast traffic. Excessive broadcast traffic may lead to network performance depreciation, or even cause network failures such as slow network and intermittence.

The network will be less influenced if broadcast traffic is small. However, the influence of broadcast packets to the network cannot be eliminated. In Ethernet, there are a lot of protocols such as ARP, RARP, NETBEUI, SMB, DHCP, RIP, SAP, and IPX to some extent work in broadcast mode. Normally, broadcast traffic should not exceed 20% of the total traffic. To avoid broadcast storm and other network failures, network administrators should regularly check broadcast traffic in the network.

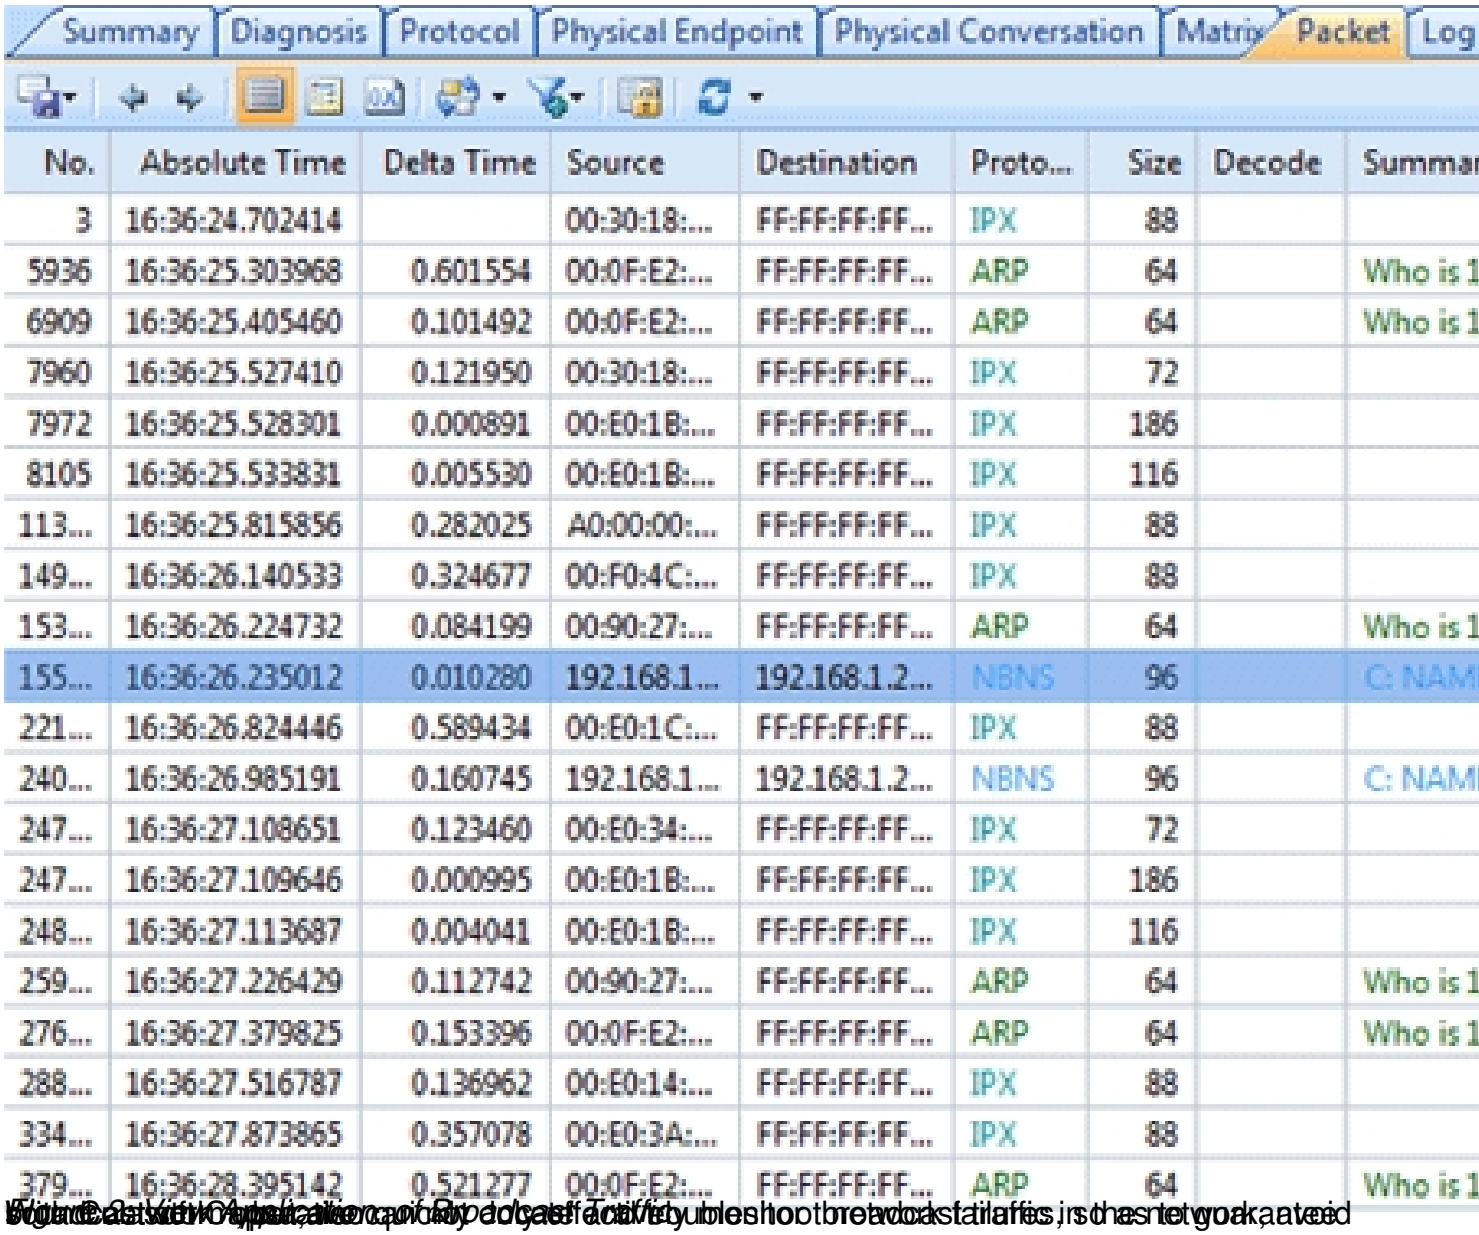

Check broadcast traffic in network

Our network is a 100M Ethernet. We can have a real-time Broadcast Traffic statistics in the **Summary** tab which provides several types of statistics (Figure 1).

Dashboard | Summary | Diagnosis | Protocol | Physical Endpoint | IP Endpoint | Physical Conversa

Statistics Item					Current Va
⊞ **Alarm**					Trigger Co
⊞ **Diagnosis Statistics**					Co
⊟ **Traffic**	Bytes	Packets	Utilization	Bits Per Second	Packets Per Seco
Total	37.621 MB	104,117	2.854%	28.541 Mbps	11,
Broadcast	666 B	5	0.000%	0 bps	
Multicast	1.688 KB	22	0.000%	0 bps	
Average Size					378.889 By
⊟ **Packet Size Distribution**	Bytes	Packets	Utilization	Bits Per Second	Packets Per Seco
